Back-Face Culling = Front Facing

- Use cross-product to get the normal of the face (not the actual normal)
- Use inner-product to check the facing

List-Priority Algorithms

- The Painter's Algorithm
- The Depth-Sort Algorithm
- Binary Space-Partitioning Trees

The Painter's Algorithm

- For the planes with constant z
- Not for real 3D, just for $2\frac{1}{2}D$
- **Sort** all polygons according to the smallest (farthest) z coordinate of each
- **Scan convert** each polygon in ascending order of smallest z coordinate (i.e., back to front)

The Painter's Algorithm

The Painter's Algorithm

FLAWED PAINTING

WHICH CANNOT BE RENDERED BY PAINTING EACH OBJECT?

The Depth-Sort Algorithm

- **Sort** all polygons according to the smallest (farthest) z coordinate of each
- Resolve any ambiguities that sorting may cause when the polygons' z extents **overlap, splitting** polygons if necessary
- **Scan convert** each polygon in ascending order of smallest z coordinate (i.e., back to front)

Overlap Cases

Overlap Detection

- If $z_{\min}(P) < z_{\min}(Q) < z_{\max}(P)$
- Do the polygons' x not overlap?
- Do the polygons' y not overlap?
- Is P entirely on the opposite side of Q's plane from the viewpoint?
- Is Q entirely on the same side of P's plane as the viewpoint?
- Do the projections of the polygons onto the (x,y) plane not overlap?

Binary Space-Partitioning Trees

Extremely efficient for static objects

The z-Buffer Algorithm

```
void zBuffer() {  
    int pz;  
    for(each polygon) {  
        for(each pixel in polygon's projection) {  
            pz=polygon's z-value at(x,y);  
            if(pz>=ReadZ(x,y)) {  
                writeZ(x,y,pz);  
                writePixel(x,y,color);  
            }  
        }  
    }  
}
```

Scan-Line Algorithm

Scan-Line Algorithm

ET entry:

x	y_{max}	dx	ID	
-----	-----------	------	----	--

PT entry:

ID	$Plane\ eq.$	Shading info	In-out
------	--------------	--------------	--------

AET contents

Scan line	Entries
α	AB AC
β	AB AC FD FE
$\gamma, \gamma + 1$	AB DE CB FE
$\gamma + 2$	AB CB DE FE

ET = edge table

PT = polygon table

AET = active-edge table

General Scan-Line Algorithm

```
Add surfaces to surface table (ST);
Initialize active-surface table (AST);
for(each scan line) {
    update AST;
    for(each pixel on scan line) {
        determine surfaces in AST that project to pixel;
        find closest such surface;
        determine closest surface's shade at pixel;
    }
}
```

Ray Tracing = Ray Casting

```
Select center of projection and window on viewplane;
for(each scan line in image) {
    for(each pixel in scan line) {
        determine ray from center of projection through pixel;
        for(each object in scene) {
            if(object is intersected and is closest considered
               thus far)
                record intersection and object name;
        }
        set pixel's color to that at closest object intersection;
    }
}
```

Warnock's Algorithm

An area-subdivision algorithm

Warnock's Algorithm

An area-subdivision algorithm

- 1. All the polygons are disjoint from the area
- 2. There is only one intersecting or only one contained polygon
- 3. There is a single surrounding polygon, but no intersecting or contained polygons
- 4. More than one polygon is intersecting, contained in, or surrounding the area, but one is a surrounding polygon that is in front of all the other polygons

Warnock's Algorithm

surrounding

intersecting

contained

disjoint

Warnock's Algorithm

Performance of Four Algorithms for Visible-Surface Determination

Algorithm	Number of Polygons		
	100	2,500	60,000
Depth sort	1	10	507
Z-buffer	54	54	54
Scan line	5	21	100
Warnock area subdivision	11	64	307
